

# Kabylake-H/LP - Intel® Management Engine Firmware 11.7

## Consumer Firmware Bring Up Guide

---

*July 2017*

Revision 1.7

**Intel Confidential**

By using this document, in addition to any agreements you have with Intel, you accept the terms set forth below. You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH Intel® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice.

The Kabylake Platform and Kabylake PCH products may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel® AMT should be used by a knowledgeable IT administrator and requires enabled systems, software, activation, and connection to a corporate network. Intel AMT functionality on mobile systems may be limited in some situations. Your results will depend on your specific implementation. Learn more by visiting [Intel® Active Management Technology](#).

Intel® Small Business Technology (Intel® SBT) requires an Intel® Small Business Technology enabled system and proper configuration. Availability of features will depend upon the setup and configuration by your PC manufacturer. Consult your system manufacturer.

Intel® vPro™ Technology requires setup and activation by a knowledgeable IT administrator. Availability of features and results will depend upon the setup and configuration of your hardware, software and IT environment. Learn more at: <http://www.intel.com/technology/vpro>.

Any software source code reprinted in this document is furnished under a software license and may only be used or copied in accordance with the terms of that license.

64-bit computing on Intel architecture requires a computer system with a processor, chipset, BIOS, operating system, device drivers and applications enabled for Intel® 64 architecture. Processors will not operate (including 32-bit operation) without an Intel® 64 architecture-enabled BIOS. Performance will vary depending on your hardware and software configurations. Consult with your system vendor for more information.

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See [http://www.intel.com/products/processor\\_number](http://www.intel.com/products/processor_number) for details. I2C is a two-wire communications bus/protocol developed by Philips. SMBus is a subset of the I2C bus/protocol and was developed by Intel. Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

Microsoft\*, Windows\* and the Windows\* logo are trademarks or registered trademarks of Microsoft Corporation in the United States and/or other countries.

Intel, Celeron, Pentium, Intel Xeon, Intel Core, Intel vPro™, and the Intel logo are trademarks of Intel Corporation in the United States and/or other countries. \*Other names and brands may be claimed as the property of others.

KVM Remote Control (Keyboard, Video, Mouse) is only available with Intel® Core™ i5 vPro™ and Core™ i7 vPro™ processors with integrated graphics and Intel® Active Management technology activated. Discrete graphics are not supported.

# 1 Introduction

---

This document covers the Intel® Management Engine Firmware (Intel® ME) 11.7 - Consumer Firmware bring up procedure. Intel® ME is tied to essential platform functionality — this dependency cannot be avoided for engineering reasons.

The bring up procedure primarily involves building a Serial Peripheral Interface (SPI) Flash image that will contain:

- **[required]** Descriptor region — Contains sizing information for all other SPI Flash image regions, SPI settings (including Vendor Specific Configuration - or VSCC - tables, SPI device parameters), and region access permissions.
- **[required]** BIOS region — Contains firmware for the processor (or host) and/or Embedded Controller (EC).
- **[required]** Intel® ME FW region — Contains firmware for the Intel® Management Engine.
- **[optional]** GbE region — Contains firmware for Intel LAN solution.

For more details on SPI Flash layout, see the document **Kabylake-H / LP SPI Programming Guide** SPI Programming Guide and [Appendix A](#). Once the SPI Flash image is built, it will be programmed to the target based platform and the platform will be booted. This document also covers any tests and checks required to ensure that this boot process is successful and that Intel® ME Consumer FW is operating as expected.

CDI # 559465 Intel® Ethernet Connection i219 [Jacksonville]

## 1.2 Intel® ME FW Features

This firmware release includes the following applications:

- Platform Clocks – Tune clock silicon to the parameters of a specific board, configure clocks at run time, and power management clocks. **Benefit:** Allows extensive customizability and soft control of “Third generation” clock solution and makes clocks available before CPU powers up.
- Silicon Workaround Capability – Intel® ME FW will have limited capabilities to perform targeted workarounds for silicon issues. **Benefit:** Allows Intel® ME FW to address some issues that otherwise would require a new silicon stepping.

## 1.3 Prerequisites

Before this document is read and utilized, it is essential that the reader first review the Consumer FW Release Notes (included with this Intel® ME Consumer FW kit).

This document is constructed so that the reader can complete the bring up steps as given for the Intel Customer Reference Board (CRB). However, in the case that bring up is being performed on a different Intel® x based platform, this document will highlight any changes that must be imposed onto the bring up steps accordingly.

This document makes only the following limited assumptions regarding hardware:

- The platform is Kabylake LP/H based
- The platform is equipped with one or more SPI Flash devices with a total capacity sufficient for storing all relevant firmware images.

## 1.4 Acronyms and Definitions

### 1.4.1 General

Acronym or Term	Definition
BIOS	Basic Input Output System
DIMM	Dual In-line Memory Module
DMI	Direct Media Interface
EC	Embedded Controller
FPF	Field Programmable Fuses
FW	Firmware
GbE	Gigabit Ethernet
HECI	Host Embedded Controller Interface (aka Intel® MEI)
Intel® ICCS	Intel® Integrated Clock Controller Service
Intel® ME	Intel® Management Engine (Intel® ME)
Intel® MEI	Intel® Management Engine Interface (Intel® MEI) (renamed from HECI)
Intel® PTT	Intel® Platform Trusted Technology (Intel® PPT)
Intel® MSS	Intel® Management and Security Status Application
KVM	Keyboard, Video, Mouse
LAN	Local Area Network
MCP	Multi-Chip Package (Central Processing Unit / Platform Controller Hub)
NVM	Non-Volatile Memory
OOB	Out-of-Band
OS	Operating System
PAVP	Protected Audio and Video Path
PCI	Peripheral Component Interconnect
PCIe*	Peripheral Component Interconnect Express
PHY	Physical Layer (Networking)
RTC	Real Time Clock
SBT	Intel® Small Business Technology
SMBus	System Management Bus
SPI Flash	Serial Peripheral Interface Flash
TPM	Trusted Platform Module
VSCC	Vendor Specific Configuration

## 1.4.2 Intel® Management Engine

Acronym or Term	Definition
3PDS	3rd Party Data Storage
Agent	Software that runs on a client PC with OS running
End User	The person who uses the computer (either Desktop or Mobile). In corporate, the user usually does not have administrator privileges.
Host or Host CPU	The processor that is running the operating system. This is different than the management processor running the Intel® Management Engine Firmware.
Host Service/Application	An application that is running on the host CPU
INF	An information file (.inf) used by Microsoft* operating systems that supports the Plug & Play feature. When installing a driver, this file provides the OS the necessary information about driver filenames, driver components, and supported hardware.
Intel® Management Engine Interface (Intel® MEI)	Interface between the Management Engine and the Host system
Intel® MEI driver	Intel® ME host driver that runs on the host and interfaces between ISV Agents and the Intel® ME HW.
IT User	Information Technology User. Typically very technical and uses a management console to ensure functionality of multiple PCs on a network.
LMS	Local Management Service: A SW application which runs on the host machine and provide a secured communication between the ISV agent and the Intel® Management Engine Firmware.
Intel® ME	Intel® Management Engine: The embedded processor residing in the chipset MCP
MECI	ME-VE Communication Interface
NVM	Non-Volatile Memory: A type of memory that will retain its contents even if power is removed. In the Intel® AMT current implementation, this is achieved using a FLASH memory device.
OOB Interface	Out Of Band interface: This is WSMAN interface over secure or non-secure TCP protocol.
OS not Functional	The Host OS is considered non-functional in Sx power state and any one of the following cases when system is in S0 power state: <ul style="list-style-type: none"> <li>• OS is hung</li> <li>• After PCI reset</li> <li>• OS watch dog expires</li> <li>• OS is not present</li> </ul>
System States	Operating System power states such as S0. See detailed definitions in System States and Power Management section.

### 1.4.3 System States and Power Management

Acronym or Term	Definition
G3	A system state of Mechanical Off where all power is disconnected from the system. G3 power state does not necessarily indicate that RTC power is removed.
CM0	Intel® Management Engine firmware power state where all hardware power planes are activated. The host power state is S0.
CM3	Intel® Management Engine power state where the host is in Sx. The processor DRAM Controller is turned off and DRAM power stays in off/self refresh mode. There is no UMA usage in CM3 state. Less than 1MB of SRAM used for code and data. Code is executed off of flash takes ~1mS.
CM0-PG	Core Well Powered; Intel® ME Well Powered; (Intel® ME core not consuming power) DRAM available.
CM3-PG	An Intel® ME Firmware power state where no power is applied to the Management Engine subsystem. (Intel® ME firmware is shut down).
OS Hibernate	System state where the OS state is saved on the hard drive.
S0	A system state where power is applied to all HW devices and the system is running normally.
S1, S2, S3	A system state where the host CPU is halted but power remains available to the memory system (memory is in self-refresh mode).
S4	A system state where the host CPU and memory are not active.
S5	A system state where all power to the host system is off, however the power cord (and/or battery in mobile designs) is still connected.
Shut Down	Equivalent to the S5 state.
Snooze Mode	Intel® Management Engine activities are mostly suspended to save power. The Intel® Management Engine monitors HW activities and can restore its activities depending on the HW event.
Standby	System state where the OS state is saved in memory and resumed from the memory when mouse/keyboard is clicked.
Sx	All S states which are different than S0.

## 1.5 Reference Documents

Document	Doc Number/ Location*
<i>Kabylake Intel® Management Engine (Intel® ME) and Embedded Controller Interaction Product Specification Revision 0.5</i>	549024 / CDI
<i>Intel® Management Engine BIOS Writers Guide</i>	TBD / *
<i>Intel® Management Engine (Intel® ME) 11 SKU Firmware Consumer Compliance Guide for Kabylake PCH-H/LP Chipset Family - Kabylake Platform Compliancy and Testing Guide - Revision 1.1</i>	547408/ CDI

**Note:** \* Unless specified otherwise, a document can be ordered by providing its reference number to your Intel Field Applications Engineer.

## 1.6 Format and Notation

The formats and notations used within this document model are those typically used by BIOS vendors. This section describes the formatting and the notations that will be followed in this document.

Table 1-1. Number Format Notation

Number Format	Notation	Example
Decimal (default)	d	14d. Note that any number without an explicit suffix can be assumed to be decimal.
Binary	b	1110b
Hex	h	0Eh
Hex	0x	0x0E

Table 1-2. Data Format Notation

Data Type	Notation	Size
Bit	b	Smallest unit, 0 or 1
Byte	B	8 bits
Word	W	16 bits or 2 bytes
Double-word	DW	32 bits or 4 bytes
Quad-word	QW	8 bytes or 4 words
Kilobyte	KB	1024 bytes
Megabit	Mb	1,048,576 bits or 128 KB
Megabyte	MB	1,048,576 bytes or 1024 KB
Gigabit	Gb	1,073,741,824 bits
Gigabyte	GB	1024 MB

## 1.7 Kit Contents

The Intel® ME Consumer FW kit can be downloaded from VIP (<https://platformsw.intel.com/>). The contents of this kit are detailed below (Note that only key files are listed).

Table 1-3. Kit Contents (Sheet 1 of 4)

File or [Directory]	Content Description
[root]	Root directory
Consumer FW Bring Up Guide.pdf	This document
Kabylake-H Client SPI Programming Guide.pdf	How to program SPI device parameters and descriptor region details. Also contains a complete SPI Flash softstrap reference.
Kabylake-LP Client SPI Programming Guide.pdf	How to program SPI device parameters and descriptor region details. Also contains a complete SPI Flash softstrap reference.
[Image Components]	
[BIOS]	
PreProduction_KBLX085_0184_02_RomImages_ReleaseBuild.rom	BIOS image only for Intel CRB.

## 1.8 External Hardware Requirements for Bring Up

Acquire the following hardware tools before moving on to the next step.

Windows* OS System	Flash Burner	DOS Bootable USB Key
		
<p><b>Equipment:</b></p> <ul style="list-style-type: none"> <li>Laptop or desktop that supports win32 applications</li> </ul> <p><b>Purpose:</b></p> <ul style="list-style-type: none"> <li>Will run firmware image assembly and build process software.</li> </ul>	<p><b>Equipment:</b></p> <ul style="list-style-type: none"> <li>(Optional) For platforms that don't boot, a Flash Chip Programmer will be required</li> <li>For platforms that can boot to DOS or Windows*, a Intel® FPT is provided in this kit</li> </ul> <p><b>Purpose:</b></p> <ul style="list-style-type: none"> <li>Will burn firmware images onto the target system Flash device(s).</li> </ul>	<p><b>Equipment:</b></p> <ul style="list-style-type: none"> <li>A DOS Bootable USB Key (Size &gt; 512 MB)</li> </ul> <p><b>Purpose:</b></p> <ul style="list-style-type: none"> <li>Acting as a bootable device and will be used to run Intel® FPT (fpt.exe) directly on the system that is undergoing Bring Up process.</li> <li>Or will be used to transfer a firmware image onto a Flash burner.</li> </ul>

§ §

## 2 Image Creation: Intel® Flash Image Tool

---

Intel® Flash Image Tool (Intel® FIT) can be used to generate either a full SPI Flash binary image with Descriptor, GbE, BIOS, and Intel® ME Regions. Additionally, it can be used to create a simple image containing only the Intel® ME Region only for use with custom SPI Flash binary image assembly solutions. Use the steps shown in following sections.

After this image has been created, it will need to be burned onto the target platform's SPI Flash device(s). [Section 3, "Programming SPI Flash Devices and Checking Firmware Status"](#) later in this document provides steps to do this.

**Note:** The Flash Image Tool may be updated throughout the release cycles. As a general rule, please ensure you use the tools, images and other content from the same kit and refrain from using different version tools.

### 2.1 Start Intel® FIT

1. Invoke Intel® Flash Image Tool. Using Explorer\*, navigate to **[root]\Tools\System Tools\Flash Image Tool**. Verify that the directory contents are correct (see [Section 1.7](#)). Double-click **FIT.exe**.
2. **NOTE:** In the tables below, where default settings are listed for KBL LP/H, if the value is the same one value will be listed. If there is a different default value when the program loads with either platform, both values will be listed to show the difference.

### 2.2 Step-by-Step Guide to Build SPI Flash Image with Intel® FIT Interface

Table 2-1. Intel® FIT - Initial Screen Layout (Sheet 1 of 7)

#	Label	Contents
1	New	This button labeled 'New' on rollover allows opening of a new session with default values
2	Open	This button labeled 'Open' on rollover allows opening of an xml or bin file
3	Save	This button labeled 'Save' on rollover allows saving of xml file
4	Clear Console	This button labeled 'Clear Console' clears the console area (see page 23)
5	Build Settings	This button labeled 'Build Settings' brings up the build settings popup Window see (Table 2-2)
6	Build Image	This button labeled 'Build Image' on rollover allows build of the image

Table 2-1. Intel® FIT - Initial Screen Layout (Sheet 2 of 7)

#	Label	Contents
7	Drop Down Selector	This drop down allows selection of platform
8	Drop Down Selector	This drop down allows selection of SKU within platform selected

Table 2-1. Intel® FIT - Initial Screen Layout (Sheet 5 of 7)

#	Label	Contents
		<p>The screenshot shows the Intel® Flash Image Tool (FIT) interface. The 'Flash Layout' sidebar on the left contains the following tabs: Flash Layout, Flash Settings, Intel(R) ME Kernel, Intel(R) AMT, Platform Protection, Integrated Clock Controller, Networking &amp; Connectivity, Flex I/O, Internal PCH Buses, GPIO, Power, Integrated Sensor Hub, Debug, and CPU Straps. A red box highlights the first four tabs, which are numbered 12 through 15. The main workspace displays the 'Descriptor Region' configuration table, which includes parameters like Length, OEM, and GbE Binary File. The table also includes a 'Help Text' column for each parameter.</p>
12	Intel® AMT Tab	<p>Intel® AMT which contains (see <a href="#">Table 2-6</a>):</p> <ul style="list-style-type: none"> <li>Intel® AMT Configuration</li> <li>KVM Configuration</li> <li>Provisioning Configuration</li> <li>OEM Customizable Certificates (1, 2, 3)</li> <li>OEM Default Certificates (1, 2, 3, 4, 5)</li> <li>Redirection Configuration</li> <li>TLS Configuration</li> </ul>
13	Platform Protection Tab	<p>Platform Protection which contains (see <a href="#">Table 2-7</a>):</p> <ul style="list-style-type: none"> <li>Content Protection</li> <li>Graphics uController</li> <li>Hash Key Configuration for Bootguard / ISH</li> <li>Boot Guard Configuration</li> <li>Intel® PTT Configuration</li> <li>TPM Over SPI Bus Configuration</li> </ul>
14	Integrated Clock Controller Tab	<p>Integrated Clock Controller which contains (see <a href="#">Table 2-8</a>):</p> <ul style="list-style-type: none"> <li>Integrated Clock Controller Policies</li> <li>Profiles</li> </ul>
15	Networking & Connectivity Tab	<p>Networking &amp; Connectivity which contains (see <a href="#">Table 2-9</a>):</p> <ul style="list-style-type: none"> <li>Wired LAN Configuration</li> <li>Wireless LAN Configuration</li> <li>Intel® NFC Configuration</li> </ul>

Table 2-1. Intel® FIT - Initial Screen Layout (Sheet 6 of 7)

#	Label	Contents
16	Flex I/O Tab	Flex I/O which contains (see <a href="#">Table 2-10</a> ): <ul style="list-style-type: none"> <li>Intel® RST for PCIe Configuration</li> <li>PCIe Lane Reversal Configuration</li> <li>PCIe Port Configuration</li> <li>SATA / PCIe Combo Port Configuration</li> <li>SATA / PCIe Combo Port Select Polarity</li> <li>USB3 Port Configuration</li> <li>XHCI Port Configuration</li> </ul>
17	Internal PCH Buses Tab	Internal PCH Buses which contains (see <a href="#">Table 2-11</a> ): <ul style="list-style-type: none"> <li>OPI Configuration</li> <li>DMI Configuration</li> <li>eSPI Configuration</li> <li>PCH Timer Configuration</li> <li>SMBus / SMLink Configuration</li> </ul>

#	Parameter	Platform	Settings
	<b>BCLK PLL Clock Source Minimum Frequency</b> - This parameter allows user to specify the minimum frequency that can be applied to BCLK clock source when underclocking the platform. Value is limited by divider/frequency limits determined by HW SKU, and cannot be greater than 100 MHz. <b>Standard Setting Profile Type</b> - Option is grayed out. <b>Adaptive Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Plus Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Ext. Setting Profile Type</b> - Option is able to be edited.	KBL-Y KBL-U KBL-H KBL-S HEDT	
	<b>BCLK SSC Changes Allowed</b> - This parameter allows user to specify if the spread mode and percentage is allowed to be modified at runtime or not. If set to "True": Runtime modification is allowed. <b>Standard Setting Profile Type</b> - Option is grayed out. <b>Adaptive Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Plus Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Ext. Setting Profile Type</b> - Option is able to be edited.	KBL-Y KBL-U KBL-H KBL-S HEDT	
	<b>BCLK SSC Halt Allowed</b> - This parameter allows user to select if the spread generator can be disabled at runtime or not. If set to "True", the spread generator can be enabled and disabled at runtime. <b>Standard Setting Profile Type</b> - Option is grayed out. <b>Adaptive Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Plus Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Ext. Setting Profile Type</b> - Option is able to be edited.	KBL-Y KBL-U KBL-H KBL-S HEDT	
	<b>BCLK SSC Percentage</b> - This parameter Specifies the maximum percentage of spread adjustment that can be applied to the clock. Value is specified in 1/100th of percent(50=0.5%) <b>Standard Setting Profile Type</b> - Option is grayed out. <b>Adaptive Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Plus Setting Profile Type</b> - Option is able to be edited. <b>Overclocking Ext. Setting Profile Type</b> - Option is able to be edited.	KBL-Y KBL-U KBL-H KBL-S HEDT

#	Parameter	Platform	Settings
	<b>CLKREQ SRC8 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC8.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC9 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC9.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC10 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC10.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC11 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC11.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC12 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC12.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC13 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC13.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC14 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC14.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>CLKREQ SRC15 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable the dynamic clock request control by the assigned CLKREQ# for CLKOUT_SRC15.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled

Table 2-8. Intel® FIT - Integrated Clock Controller (Sheet 18 of 20)

	<b>CLKRUN LPC0 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable CLKRUN protocol on LPC1 output clock.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>CLKRUN LPC1 Enable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable CLKRUN protocol on LPC1 output clock.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of Core 24MHz Crystal Disable</b> <b>Values: Enabled/Disabled</b> This parameter decides if Crystal is forced to be on or is subjected to dynamic shutdown. Crystal Oscillator can dynamically shut down upon iSCLK detecting idle condition on all clock consumers of crystal clock. <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of CLKOUT_ITPxDP Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic control of CLKOUT_ITPxDP. When enabled, CLKOUT_ITPxDP is subject to gating/ungating control by CPUBCLKREQ <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled

Table 2-8. Intel® FIT - Integrated Clock Controller (Sheet 19 of 20)

#	Parameter	Platform	Settings
	<b>Clock Gating of CLKOUT_CPUBCLK Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic control of CLKOUT_CPUBCLK. When enabled, CLKOUT_CPUBCLK is subject to gating/ungating control by CPUBCLKREQ These settings should match with platform hardware design. <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of CLKOUT_CPUPCIBCLK Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic control of CLKOUT_CPUPCIBCLK. When enabled, CLKOUT_CPUPCIBCLK is subject to gating/ungating control by CPUPCIBCLKREQ <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	NA NA Enabled Enabled Enabled
	<b>Clock Gating of CLKOUT_CPUNSSC Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic control of CLKOUT_CPUNSSC. When enabled, CLKOUT_CPUNSSC is subject to gating/ungating control by CPUNSSCCLKREQ <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of CLKOUT_CPUNSSC[P/N] Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic control of CLKOUT_CPUNSSC[P/N]. Controls the parked state of True (P) and Complementary (N) copies of the differential pair when CLKOUT_CPUNSSC[P/N] is dynamically gated under S0 idle state. <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of icc_rosc_fast_clk Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic clock gate on icc_rosc_fast_clk <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>Clock Gating of icc_rosc_side_clk Disable</b> <b>Values: Enabled/Disabled</b> This parameter allows user to Enable/Disable dynamic clock gate on icc_rosc_side_clk <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	Enabled Enabled Enabled Enabled Enabled
	<b>USB3Gen2PCIe PLL OFF Wait</b> This parameter allows user to set G2PLLOFFWAIT timer value. Once timer expires and there are no wake events, the USB3Gen2PCIe PLL can be shutdown <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	8us 8us 8us 8us 8us
	<b>USB3Gen2PCIe PLL PG Wait</b> This parameter allows user to set G2PLLPGWAIT timer value. Once timer expires and there are no wake events, the USB3Gen2PCIe PLL can be shutdown <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	8us 8us 8us 8us 8us
	<b>Run-time S0 SUS PG Wait</b> This parameter allows user to set SUSPGWAIT timer value. Once timer expires and there are no wake events, the USB3Gen2PCIe PLL can be shutdown <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	8us 8us 8us 8us 8us

Table 2-8. Intel® FIT - Integrated Clock Controller (Sheet 20 of 20)

#	Parameter	Platform	Settings
	<b>Crystal Oscillator Fast Restart Mode</b> This parameter allows user to configure Crystal Oscillator Fast Restart Mode. In all below listed fast start modes, iSCLK kickstarts crystal XIN/ XOUT by injecting a 24Mhz kickstart reference clock onto these pins.  <b>Note:</b> Configuration of this parameter co-relates to configuration of <b>Clock Gating of Core 24MHz Crystal Disable</b> parameter.  If Clock Gating of Core 24MHz Crystal Disable is set to ' <b>Disable</b> ', Crystal Oscillator Fast Restart Mode parameter has <b>no impact</b> .  If Clock Gating of Core 24MHz Crystal Disable is set to ' <b>Enabled</b> ', Crystal Oscillator Fast Restart Mode parameter <b>must be set to '01b'</b> . Other value like '00b' can cause wake latency conflict which can cause platform functional issue.	KBL-Y KBL-U KBL-H KBL-S HEDT	01b 01b 01b 01b 01b
	<b>BCLK PLL Shutdown Wait Interval</b> This parameter allows user to enable Dynamic power management of BCLK PLL. Upon the event that all conditions (other than this wait timer itself) are satisfied for iSCLK dynamic PLL shutdown, a timer is started. Once it expires and there are no wake events, this PLL will shutdown. <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	8us 8us 8us 8us 8us
	<b>24MHz Crystal Shutdown Wait Interval</b> This parameter allows user to Enable Dynamic power management of Crystal. Upon the event that all conditions (other than this wait timer itself) are satisfied for iSCLK crystal shutdown, a timer is started. Once it expires and there are no wake events, iSCLK will shutdown crystal. <b>Note:</b> Recommendation is to leave setting at default value.	KBL-Y KBL-U KBL-H KBL-S HEDT	8us 8us 8us 8us 8us

Table 2-16. Intel® FIT - CPU Straps (Sheet 4 of 4)

#	Parameter	Platform	Settings
	<b>GT_US Power Plane Topology</b> This setting determines the GT Unslice power plane topology. See Processor EDS for details. <b>Note:</b> This strap should be left at the recommended default setting. <b>FOR KBL-U 23e GT3 Only</b> - If using GT merged power plane the value should be 0x1.	KBL-Y KBL-U KBL-H KBL-S HEDT	0x1 0x3 0x3 0x3 NA
	<b>GT_US VR Type</b> <b>Value: SVID/Fixed VR</b> This setting determines the GT Unslice domain VR type. See Processor EDS for details.	KBL-Y KBL-U KBL-H KBL-S HEDT	SVID SVID SVID SVID NA
	<b>GT_S Power Plane Topology</b> This setting determines the GT slice power plane topology. See Processor EDS for details. <b>Note:</b> This strap should be left at the recommended default setting.	KBL-Y KBL-U KBL-H KBL-S HEDT	0x1 0x1 0x1 0x1 NA
	<b>GT_SVR Type</b> <b>Value: SVID/Fixed VR</b> This setting determines the GT slice domain VR type. See Processor EDS for details.	KBL-Y KBL-U KBL-H KBL-S HEDT	SVID SVID SVID SVID NA
	<b>SVID Presence</b> <b>Value: SVID Present/SVID Not Present</b> This setting determines if SVID rails are present on the platform. See Processor EDS for details.	KBL-Y KBL-U KBL-H KBL-S HEDT	SVID Present SVID Present SVID Present SVID Present
	<b>Platform IMON Disable</b> This strap should be left at the recommended default setting.	KBL-Y KBL-U KBL-H KBL-S HEDT	0x0 0x0 0x1 0x1 NA
	<b>eOPPIO Power Plane Topology</b> This setting determines the eOPPIO power plane topology. See Processor EDS for details. <b>Note:</b> This strap should be left at the recommended default setting.	KBL-Y KBL-U KBL-H KBL-S HEDT	0x00000000 0x00000000 0x00000005 0x00000005 NA
	<b>eOPPIO VR Type</b> <b>Value: SVID/Fixed VR</b> This setting determines the eOPPIO domain VR type. See Processor EDS for details.	KBL-Y KBL-U KBL-H KBL-S HEDT	Fixed VR Fixed VR Fixed VR Fixed VR NA
	<b>EDRAM Power Plane Topology</b> This setting determines the EDRAM power plane topology. See Processor EDS for details. <b>Note:</b> This strap should be left at the recommended default setting.	KBL-Y KBL-U KBL-H KBL-S HEDT	0x00000000 0x00000000 0x00000004 0x00000004 NA
	<b>EDRAM VR Type</b> <b>Value: SVID/Fixed VR</b> This setting determines the EDRAM domain VR type. See Processor EDS for details.	KBL-Y KBL-U KBL-H KBL-S HEDT	Fixed VR Fixed VR Fixed VR Fixed VR NA
	<b>SE Key Mode</b> <b>Note:</b> This strap should be left at the recommended default setting.	KBL-Y KBL-U KBL-H KBL-S HEDT	0 0 0 0 NA

Table 2-17. Intel® FIT - Build Image

#	Parameter	CRB	Values
1	Green Build button		Can also select CTRL+B, or Build> Build Image from the menu bar along the top of the screen
2	Console shows status of build and path where saved		

## 3 Programming SPI Flash Devices and Checking Firmware Status

---

Now that the Flash image file has been created, it can be programmed into the SPI Flash device(s) of the target machine. For platforms that don't boot, a Flash Chip Programmer will be required. For platforms that can boot to DOS or Windows\*, the Intel® FPT can be used.

### 3.1 Flash Burner/Programmer

The specific use of a Flash burner/programmer is beyond the scope of this document. Here are some general steps that may be followed:

1. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**.

If two total SPI Flash devices were specified during the build process, then additional image files will be saved, one for each SPI Flash device. These files are assumed to be named **outimage(1).bin** and **outimage(2).bin**.

2. Utilize a Flash burner/programmer to program the image(s). For multiple SPI Flash devices, the images are numbered sequentially to correspond to the first and second SPI Flash device accordingly.

#### 3.1.1 In-Circuit SPI Flash Programming for CRB

Mobile CRBs have the SPI Flash devices soldered down. As a result, to program the SPI Flash for mobile CRBs, follow these steps:

1. Leave CRB powered on.
2. Connect Flash Programmer (such as DediProg SF600) header to connector **J3F3** which is labelled "**SPI TPM**". Make sure to line up pin 1 on the header.
3. Program the first image [outimage(1).bin] to the CRB.
4. In Dediprog software, select application memory chip 2 button and load second image if created.
5. Program the second image [outimage(2).bin] to the CRB if created.
6. Once programming is complete, disconnect the Flash Programmer header. Power off and unplug CRB. Remove cell coin battery, wait approximately 10 seconds. Replace cell coin battery, plug CRB back in and power on.

### 3.2 Flash Programming Tool (Intel® FPT)

Intel® FPT can be used to substitute for a Flash burner/programmer, provided the system is capable of booting to a DOS or Windows\* OS.

**Note:** Intel® FPT will automatically disable the Intel® ME or EFI prior to flashing the image to the platform.

### Intel® FPT DOS Version

The DOS versions supported by Intel® FPT are: DOS, Free DOS, and DRMK DOS. Use the following steps to program the SPI Flash devices,

1. Copy all the files in the “(root)\Tools\System Tools\Flash Programming Tool\DOS” directory to the root directory of a bootable USB key.
2. Navigate to your **Output Directory** (as specified in Table 2-2) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to the root directory of the USB key.
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
fpt.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

**Note:** If the SPI Flash device does not currently contain a descriptor it may report only a single device.

4. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fpt.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

5. Execute a platform global reset using Intel® FPT -greset. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

### 3.2.1 Intel® FPT Windows\* Version

The Windows\* OS versions supported by Intel® FPT are: Windows\* PE 64, Windows\* 7, Windows\* 8/8.1. There are two versions of Intel® FPT for Windows\*: a 32-bit version and a 64-bit version. Most Windows\* OS, Windows\* 7 (32-bit or 64-bit), Windows\* 8/8.1 (32-bit or 64-bit) can use Windows\* version of Intel® FPT. However, Windows\* OS which do not support 32 bit compatible mode (Win PE 64-bit) **must use** Intel® FPT Windows\* 64-bit version due to compatibility issues.

Use the following steps to program the SPI Flash devices,

1. Navigate to your **Output Directory** (as specified in [Table 2-2](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to Intel® FPT directory located at "(root)\Tools\System Tools\Flash Programming Tool\Windows".
2. Boot the target system to Windows\* and open a Command Prompt window. In this window, change to the Intel® FPT directory and at the prompt type:

```
fptw.exe -i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

**Note:** If the SPI Flash device does not currently contain a descriptor it may report only a single device.

3. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fptw.exe -f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

4. Use `fptw.exe -greset` to perform a G3 power cycle. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

### 3.3 Checking Intel® ME Firmware Status

Use the following steps to check the platform health and Intel® ME FW status,

1. Copy the file **MEInfo.exe** in the "(root)\Tools\System Tools\MEInfo\DOS" directory to the root directory of a bootable USB key.
2. Boot the target system and use F2 or Del to enter the BIOS setup menu. Load default values for BIOS (on Intel® CRBs press F3 to load default values). Save and reboot (on Intel® CRBs press F4 and select Yes).
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
MEInfo.exe -fwsts
```

The system should respond with a message similar to below.

```
Intel® MEInfo Version: 11.7.0.xxxx

Copyright(C) 2005 - 2014, Intel Corporation. All rights reserved.

FW Status Register1: 0x1E000255
FW Status Register2: 0x60002306
FW Status Register3: 0x00000300
FW Status Register4: 0x00004001
FW Status Register5: 0x00000101
FW Status Register6: 0x03C00FC9

Current State: Normal
ManufacturingMode: Enabled
FlashPartition: Valid
OperationalState: M0 with UMA
InitComplete: Complete
BUPLoadState: Success
ErrorCode: No Error
ModeOfOperation: Normal
Phase: HOSTCOMM Module
ICC: Valid OEM data, ICC programmed
SPI Flash Log: Not Present
ME File System Corrupted: No
FPF and ME Config Status: Not committed
```

As in the above example if there are NO errors shown, then

- your platform's health is good
- Intel® ME FW has successfully initialized
- Intel® ME FW is operating normally

**Note:** This section is only intended to show how to use the MEInfo.exe tool for checking firmware status. For full usage and capabilities of the MEInfo.exe tool, please see the System Tools User Guide.

## 3.4 Common Bring Up Issues and Troubleshooting Table

Table 3-1. Common Bring Up Issues and Troubleshooting Table

Problem / Issue	Solution / Workaround
System does not boot to DOS	By default, the system will boot to EFI Shell. To boot to DOS, 1. Enter BIOS menu, then go to the 'Boot' screen 2. Change 'Boot Option #1' to be your USB key (ensure USB key is formatted to be DOS bootable) 3. Press 'F4' to save settings and reboot
Hear 3 beeps when platform powers on	Possible device is disconnected or device not found, check <ul style="list-style-type: none"> <li>platform power and MCP fan power connectors</li> <li>DIMM memory modules (if applicable for memory down modules)</li> <li>USB devices (keyboard, mouse, USB key) may be plugged into inactive USB port</li> <li>missing/incorrect jumpers</li> <li>missing or poorly socketed MCP</li> </ul>
No display on monitor	Ensure Corporate FW SKU supports integrated graphics. Try external graphics card.
USB device not detected or does not work	USB device may be plugged into inactive USB port
System does not boot (Post Code 00)	Incorrect Flash image – possible reasons: <ul style="list-style-type: none"> <li>wrong FW selected during Flash image build process</li> <li>wrong Flash size selected</li> </ul> Re-build image with correct settings and re-flash using Flash burner.

§ §

# A Appendix — Flash Configurations

This chapter covers only the basic information needed for clock control parameter programming. For a more detailed treatment of Mainstream - Mobile Family clocks, see Intel® Kabylake PCH-H / LP Clocks and Intel® Management Engine — Platform Compliancy Guide for ME Hardware.

Figure A-1. Configuration “A” — Desktop/Server/Workstation or Mobile

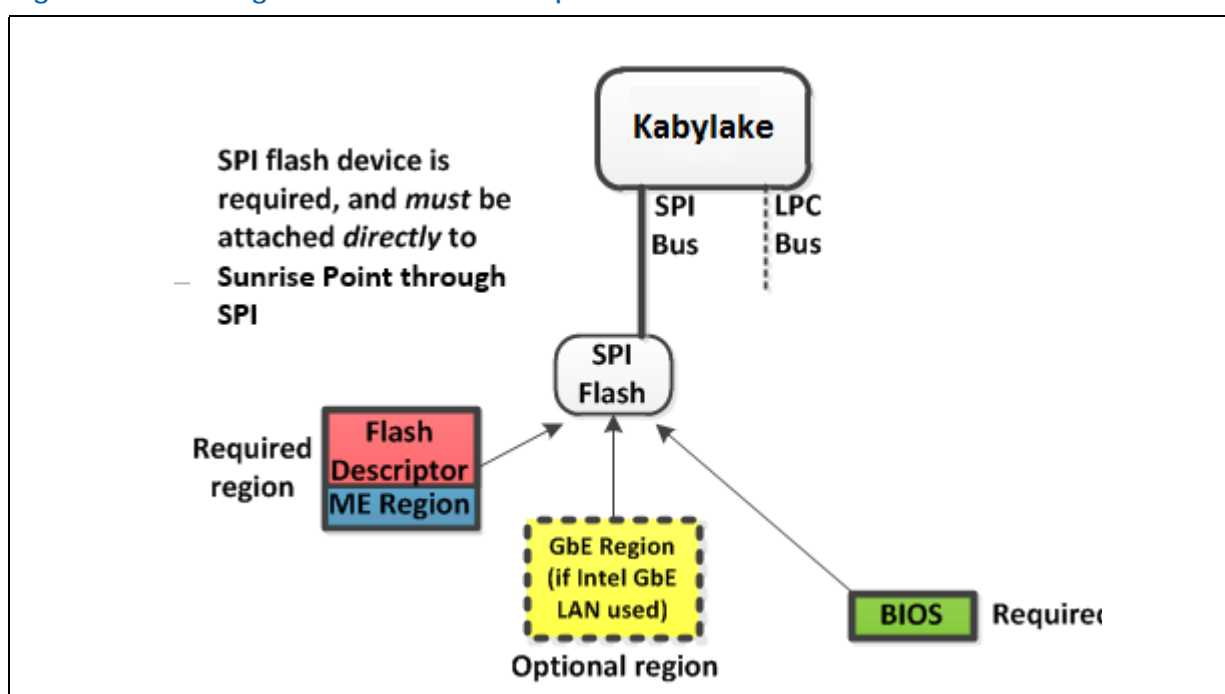

Figure A-2. Configuration “B” — Mobile Only

Figure A-3. Configuration “C” — Desktop/Server/Workstation Only

Figure A-4. Configuration “D” — Mobile Only

§ §

## B Appendix — Intel® ICCS SKU Support Matrix

The following table describes ICC features supported for specific PCH SKU, clock range (maximum and minimum), spread mode supported by Kabylake-H/LP SKUs.

**Note:** Please refer to Kabylake-H/LP Platform Controller Hub (PCH) External Design Specification (EDS) for details about Kabylake-H/LP Chipset Clock architecture

In below tables,

Min = Clock Div Max (minimum allowed frequency)

Max = Clock Div Min (maximum allowed frequency)

### B.1 Intel® ICCS SKU Matrix - KBP-LP

**Note:** ICC SKU is divided into 2 categories: Basic and Enhanced. Mark "x" indicates category supported by PCH SKU.

**Table B-1. Intel® ICCS SKU Matrix - KBP-LP**

PCH SKU	Basic	Enhanced
Premium Y		x
Premium U		x
Base U		x
<b>Features Supported</b>	Standard Clock Configuration	Standard Clock Configuration Adaptive Clock Configuration
<b>Pre-Defined ICC profile supported</b>	Standard	Standard Adaptive
<b>Clock Range Supported</b>	[Min-Max] = 100 MHz.	BCLK [Min-Max] = 98 - 100 MHz.
<b>SSC Supported</b>	Down SSC: 0 - 0.5%	Down SSC: 0 - 0.5%

## B.2 Intel® ICCS SKU Matrix - KBP-H

**Note:** ICC SKU is divided into 3 categories: Basic, Enhanced and Extreme. Mark "x" indicates category supported by PCH SKU.

**Table B-2. Intel® ICCS SKU Matrix - KBP-H**

PCH SKU	Basic	Enhanced	Extreme
Q270		X	
Q250		X	
B250		X	
H270		X	
Z270			X
X290			X
<b>Features Supported</b>	Standard clock configuration	Standard clock configuration adaptive clock configuration	Standard clock configuration adaptive clock configuration BCLK Overclocking clock configuration
<b>Pre-defined ICC Profile supported</b>	Standard	Standard Adaptive	Standard Adaptive OverClocking Overclocking Plus Overclocking Ext.
<b>Clock Range Supported</b>	[Min-Max] = 100 MHz	BCLK [Min-Max] = 98 - 100 MHz	<b>Overclocking Range support:</b>  BCLK Over clocking [Min-Max] = 99.5 -170 MHz *  BCLK Over clocking Plus [Min-Max] = 99.5 -341 MHz*  BCLK Overclocking Ext.[Min-Max] = 98.0 - 341 MHz*
<b>SSC Supported</b>	Down SSC: 0 - 0.5%	Down SSC : 0 - 0.5%	BCLK Over clocking Down SSC : 0 - 0.5%  BCLK Over clocking Plus Down SSC : 0 - 0.2%  BCLK Over clocking Ext. Down SSC : 0 - 0.2%

\*BCLK Overclocking ranges mentioned here are ranges supported by The Intel® ME FW, please make sure to choose range based on platform/HW configuration.

## B.3 How to configure CLKREQ# parameters

Below table provides guideline on how to configure CLKREQ# parameters for SRC[0:15] output clocks depending on dynamic control of the clock via CLKREQ is required or not.

Configuring CLKREQ# and assigning GPIO depends on how CLKOUT\_SRCx configuration via FIT is done (Enabled or Disabled) and if CLKREQ is required or not.

**Note:** In below table, Mask Control CLKREQ cannot be configured via FIT Tool. It's configured to default once by FW during cold boot and bios can set/clear bits anytime.

Please refer to below table and set FIT parameters accordingly.

Table B-3. How to configure CLKREQ# parameters via FIT Tool

FIT->ICC->Profile ClockOut Config. ->SRCx Parameter  configured to enabled or disabled?	Dynamic Control of SRCx clock via CLKREQ required?	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. ->SRCx CLKREQ# Mapping	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. -> CLKREQ SRCx Enable	Mask Control CLKREQ	Overall Recommendation
Enabled	Yes	Configure platform mapped/routed GPIO using this above mentioned FIT parameter.	Enabled	Leave at Default - 0b	<p>If user wants platform 's SRC clock/s to be dynamically managed; associated CLKREQ configuration is required.</p> <p>Thus either the default mapped GPIO/CLKREQ should be used or a different user defined GPIO/clreq can be used and must be mapped accordingly.</p> <p>Note: Make sure the mapped GPIO/ CLKREQ is configured in native CLKREQ mode and is routed on the platform.</p>

Table B-3. How to configure CLKREQ# parameters via FIT Tool

FIT->ICC->Profile ClockOut Config. ->SRCx Parameter  configured to enabled or disabled?	Dynamic Control of SRCx clock via CLKREQ required?	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. ->SRCx CLKREQ# Mapping	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. -> CLKREQ SRCx Enable	Mask Control CLKREQ	Overall Recommendation
Enabled	No	Keep Default	Disabled	N/A  Recomm endation is to leave at default value,	<p>if user do not want platform's SRC clock/s to be dynamically managed; no need to configure CLKREQ# associated for the specific SRC clock.</p> <p>The default mapped GPIO/CLKREQ should remain as HW default GPIO mode.</p> <p>Note that CLKREQ is not needed but SRC clock itself is still needed . In this case, the GPIO should remain as GPIO mode but there is no requirement that SRC clock buffer itself to be disabled.</p>

Table B-3. How to configure CLKREQ# parameters via FIT Tool

FIT->ICC->Profile ClockOut Config. ->SRCx Parameter  configured to enabled or disabled?	Dynamic Control of SRCx clock via CLKREQ required?	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. ->SRCx CLKREQ# Mapping	Recommendation for How to configure  FIT->ICC- >Profile  PowerMgmt Config. -> CLKREQ SRCx Enable	Mask Control CLKREQ	Overall Recommendation
Disabled	N/A  Since SRCx clock is unused/disabled.	Keep Default	Keep it enabled	Set to 1b.	If SRCx output clock is disabled, please keep FIT->ICC- >Power Management Config. -> CLKREQ SRCx Enable = Enabled  However no need to configure an associated GPIO mapping.  The default mapped GPIO should not be changed. The pin need not to be routed on the platform from the view of ARC clock control. It could be routed for GPIO associated functionality.

# C Appendix — Boot Guard Configuration

## C.1 Boot Guard Profiles

The following table describes the profiles available for Boot Guard Configuration.

Table C-1. Profile Description

Index	Profile Name	F	V	M	ENF	PBE	Description
0	Boot Guard Profile - No_FVME	0	0	0	00	0	This configuration will invoke Boot Guard during boot with neither Verification nor Measurement. For platforms with all the required Boot Guard components but do not wish to enable Boot Guard boot block verification protection.
1	Boot Guard VE	0	1	0	01	1	When Verification is desired but if verification fails the platform will continue to boot with the unverified IBB for a short period, to allow remediation.
2	Boot Guard VME	0	1	1	01	1	When Verification and Measured are desired and the asset protection is provided by both TPM protection and a timed remediation period.
3	Boot Guard VM	0	1	1	00	1	When Verification and Measured are desired and the asset protection is provided by TPM protection.
4	Boot Guard FVE	1	1	0	11	1	Strict Verification enforcement.
5	Boot Guard FVME	1	1	1	11	1	Strict Verification and Measured enforcement. Prevents unverified IBB from running.

## C.2 Enforcement Policies

Table C-2. Enforcement Policy Description

Error Enforcement Policy (ENF)	Enforcement Mode Name	Description
0	Unrestricted Mode	Infinite time before shutdown – don't shutdown the platform, let everything run normally.
1	Remediation Mode	<b>30 minutes</b> before shutdown – enough time to remediate the system, e.g. update BIOS or other data on flash via host tools.
2	Reserved	
3	Restricted Mode	<b>0 minutes</b> before shutdown – instant shutdown policy.

## C.3 OEM Profile Parameters

Table C-3. Profile Parameters Description

Parameter	Description	Settings
Force Boot Guard ACM Enabled (F)	Force Boot Guard Boot determines if the platform starts the Force Boot Guard Boot timer. If it successfully starts it indicates success. When the Force Boot Guard timer stops, it starts the Protect Bios Environment timer, if indicated by the boot policy restrictions. Anchor ACM then jumps to the Initial Boot Block (IBB) with the Force Boot Guard Boot time stopped and the Protect BIOS enable timer running.	<b>false</b> - Allow the CPU to jump to the legacy reset vector if the Boot Guard Module cannot be successfully loaded. (default)  <b>true</b> - Force the Boot Guard ACM to execute.
Verified Boot Enabled (V)	Boot Guard cryptographically verifies the platform Initial Boot Block (IBB) using the boot policy key. On successful verification, Boot Guard executes Initial Boot Block (IBB) using the boot policy key. If the verification fails, Anchor signals or enters Remediation.	<b>false</b> - Platform does not perform verified boot (default)  <b>true</b> - Platform performs verified boot
Measured Boot Enabled (M)	Boot Guard measures the Initial Boot Block (IBB) into the TPM. Boot Guard perform no verification that the IBB is correct or from the platform manufacturer. The Skylake implementation of Boot Guard will support measurements into TPM or Intel's Platform Trust Technology.	<b>false</b> - Platform does not perform measured boot (default)  <b>true</b> - Platform performs measured boot
Protect Bios Environment Enabled (PBE)	Platform manufacturer may want Initial boot block to be protected between verification/ measurement and execution from attacks on buses and non-CPU components. Boot Guard accomplishes this by allowing the initial boot block to be verified and executed in LLC in NEM if PBE is enabled.	<b>false</b> - Take no actions to control the environment during execution of the BIOS components (default)  <b>true</b> - Takes actions to control the environment during the execution of the BIOS components.
Error Enforcement Policy (ENF)	Boot Guard invokes the Enforcement Policy when a fatal error is encountered. The action taken by ENF is determined by the OEM set persistent policies. Like, <ul style="list-style-type: none"><li>• Allowing platform to continue to boot</li><li>• Immediate Shutdown</li><li>• Shutdown with Timeout intervals</li></ul> When the ENF logic is invoked, PTT or TPM also disconnects.	See <a href="#">Section C-2</a> for details.

# D Appendix — Intel® Platform Trust Technology

## D.1 Intel® Platform Trust Technology

The following table describes the platform configurations supported by Intel® Platform Trust Technology.

**Note:** Intel® Platform Trust Technology does not support the full TPM functionality requirements and should not be used for Intel® vPro™ based platforms.

**Table D-1. Intel® Platform Trust Technology Configuration table**

Configuration	Platform Protection> Intel® PTT Configuration Intel® PTT Initial power up state	Platform Protection> Intel® PTT Configuration Intel® PTT Supported	Platform Protection> Intel® PTT Configuration Intel® PTT Supported [FPF]	Description
Intel® PTT Permanently Disabled in HW via FPF	Disabled	No	No	After the End of Manufacturing command, this setting will permanently set into the FPFs contained in the MCP. If disabled, the specific MCP can never be enabled for Intel® PTT.
Intel® PTT Permanently Disabled in base firmware image	Disabled	No	Yes	This setting allows Intel® PTT to be set to disabled without disabling the MCP FPFs. This is the recommended option to permanently disable Intel® PTT on a platform.
Intel® PTT Ship State Disabled in base firmware image	Disabled	Yes	Yes	Intel® PTT initially shipped in disabled mode, can be enabled by BIOS command.
Intel® PTT Enabled	Enabled	Yes	Yes	This is the recommended option to enable Intel® PTT on a platform.

## E Appendix — Settings for RVP CRBs (B)

The following table describes the configuration settings required for RVP CRBs in the Intel® FIT tool. Please see SPI Programming Guide for additional details.

**Table E-1. Kabylake-LP RVP Board Settings**

CRB Board	Setting Name	Intel® FIT Visible	Offset	Value
RVP7	SATA / PCIe GP Select for Port 0	No	0x168 [1:0]	0x0
	SATA / PCIe GP Select for Port 2	No	0x168 [5:4]	0x3
	USB3 / PCIe Combo Port 0 Strap	No	0x16E [1:0]	0x0
	USB3 / PCIe Combo Port 1 Strap	No	0x16E [3:2]	0x0
	GbE PCIe Port Select	Yes	0x17C [5:3]	PORT4
	SATA / PCIe Combo Port 1 Strap	Yes	0x17D [3:2]	SATA
	SATA / PCIe Combo Port 3 Strap	Yes	0x180 [1:0]	GPIO
	USB3 / PCIe Combo Port 0	Yes	0x182 [1:0]	USB3
	USB3 / PCIe Combo Port 1	Yes	0x182 [3:2]	USB3
	SATA / PCIe Select for Port 1	No	0x18C [1:0]	0x0
	SATA / PCIe Select for Port 2	No	0x18C [5:4]	0x3
	PCIe Controller 1 (Port 1-4)	Yes	0x19D [4:3]	4x1
	PCIe Controller 3 (Port 9-12)	Yes	0x1AD [4:3]	1x4
	PCIe Controller 3 Lane Reversal Enabled	Yes	0x1AD [2]	Yes
	XHCI Port 4 Ownership	Yes	0x1B8 [4]	XHCI
	XHCI Port 5 Ownership	Yes	0x1B8 [5]	XHCI

**Note:** The Intel® FIT default settings for Kabylake-LP are based on the RVP3 CRB.

Table E-2. Kabylake-H RVP Board Settings

CRB Board	Intel® FIT Setting Name	Intel® FIT Visible	Offset	Value
RVP8	SATA / PCIe GP Select for Port 0	No	0x1AC [1:0]	0x3
	SATA / PCIe GP Select for Port 1	No	0x1AC [3:2]	0x3
	SATA / PCIe GP Select for Port 2	No	0x1AC [5:4]	0x0
	SATA / PCIe GP Select for Port 3	No	0x1AC [7:6]	0x0
	SATA / PCIe GP Select for Port 4	No	0x1AD [1:0]	0x3
	SATA / PCIe Combo Port 2	Yes	0x1C1 [5:4]	GPIO
	SATA / PCIe Combo Port 3	Yes	0x1C4 [1:0]	GPIO
	SATA / PCIe Combo Port 4	Yes	0x1C4 [3:2]	SATA
	SATA / PCIe Combo Port 5	Yes	0x1C4 [5:4]	SATA
	SATA / PCIe Combo Port 6	Yes	0x1C4 [7:6]	GPIO
	Polarity Select SATA / PCIe Combo Port 2	Yes	0x1C8 [2]	SATA
	Polarity Select SATA / PCIe Combo Port 3	Yes	0x1C8 [3]	SATA
	Polarity Select SATA / PCIe Combo Port 4	Yes	0x1C8 [4]	PCIe
	Polarity Select SATA / PCIe Combo Port 5	Yes	0x1C8 [5]	PCIe
	Polarity Select SATA / PCIe Combo Port 6	Yes	0x1C8 [6]	SATA
	SATA / PCIe Select for Port 0	No	0x1D0 [1:0]	0x3
	SATA / PCIe Select for Port 1	No	0x1D0 [3:2]	0x3
	SATA / PCIe Select for Port 2	No	0x1D0 [5:4]	0x0
	SATA / PCIe Select for Port 3	No	0x1D0 [7:6]	0x0
	SATA / PCIe GPIO Polarity Port 0	No	0x1D2 [0]	0x1
	SATA / PCIe GPIO Polarity Port 1	No	0x1D2 [1]	0x1
	SATA / PCIe GPIO Polarity Port 2	No	0x1D2 [2]	0x0
	SATA / PCIe GPIO Polarity Port 3	No	0x1D2 [3]	0x0
	SATA / PCIe GPIO Polarity Port 4	No	0x1D2 [4]	0x1
	PCIe Controller 4 (Port 13-16)	Yes	0x1F9 [4:3]	1x2, 2x1

# F Appendix — Integrated Sensor Hub (ISH) Public Key Settings

The following table describes the configuration matrix required for ISH configuration for the Intel® FIT tool. Please see System Tools User Guide within ME kit, Manufacturing Test with Intel® Management Engine (Intel® ME) Firmware 11 and Intel® Integrated Sensor Solution on Kabylake Mobile, Kabylake Desktop, and Greenlow Workstation Platforms (CDI # 554868) for additional details.

CLSMNF = Close Manufacturing switch used with Intel® Flash Programming Tool (FPT)

PV = Production Version

For additional information on FPT see System Tools User Guide included with ME kit under system tools folder.

**Table F-1. ISH Public Key Settings**

Firmware	MCP	FPF Automatic Commit	FPF MEI command after CLSMNF (Yes/No)	FPF MEI command before CLSMNF (Yes/No)
Pre-production	Production	No	No - Not a valid combination	No - Not a valid combination
Production (PV not set)	Pre-production	No	Yes	No
Production (PV not set)	Production	No	Yes	No
Pre-production	Pre-production	No	Yes	No
Production (PV not set)	Production	Yes	No	No

**Note:** The Intel® FIT allows integration of binary files within Integrated Sensor Hub section under ISH Image and ISH Data. The Intel® FIT does not generate or create the required files. The table above lists configuration combinations that can be used. Please see VIP # 105658 - Intel® Integrated Sensor Solution 3.0 for KBL Program Alpha Corporate Milestone Release Version 3.0.0.1037 update for firmware information.
